

Example of using references

Bibliographies can be added to markdown files to automatically create a list of references in the end of the document.

In this example a bibliography (`biblio.bib`) has been added in the YAML field, this is where R will be looking for references.

A reference is then added by specifying the reference id from the bibliography file.

A .csl file can be added to change the way the reference is created. Create a new file and add code from a .csl file or download the file directly from <https://github.com/citation-style-language/styles> (<https://github.com/citation-style-language/styles>)

If you do not want your reference list in the end of the document specify where you want references with
`<div id="refs"></div>`

Example usage

qPCR can be used to determine training induced changes in myosin heavy chain composition.¹
